Applies To: North Campus Distribution Operations  
Review Cycle: Every 12 months or after equipment redesign

## PURPOSE

This procedure covers weekly inspection and light service of the fictional E18 electric forklift battery bay. It focuses on cable condition, connector heat, hold-down hardware, residue cleanup, and ventilation path integrity.

The procedure is intended for trained maintenance technicians and shift leads. Production operators may assist with observation and restart confirmation, but they do not perform isolated service work unless the task card explicitly allows it.

## REQUIRED TOOLS AND PARTS

- Insulated hand tools, terminal brush, neutral cleaning solution, absorbent pads, inspection mirror, and torque wrench.
- Replacement vent caps, cable ties rated for battery compartments, and approved dielectric grease.
- Acid-resistant gloves, face shield, splash apron, and battery service checklist.
- Portable fan for added airflow during extended inspection if the charging area is warm or enclosed.

## HAZARDS AND CONTROLS

- Wear acid-resistant PPE before opening the bay, even if no leak is visible.
- Do not place metal tools on the battery top or bridge positive and negative terminals with a loose part or rag.
- If swelling, cracked cases, or strong sulfur odor are present, stop work and escalate to the fleet supervisor immediately.
- Use neutral cleaner only on approved surfaces and keep liquids away from control modules mounted above the battery tray.

## PREPARATION

- Park the truck in the designated service lane, key off, chock the wheels, and confirm no active charging cable is attached.
- Open the battery bay and inspect hold-downs, tray rails, cable strain relief, and vent cap seating before touching residue.

- Check for heat discoloration at the main connector and contactor leads. If discoloration is present, record the exact location and stop before reconnecting the truck for service.
- Brush away dry residue first, then clean surfaces with neutral solution and absorbent pads. Do not flood the compartment.
- Torque accessible hold-down hardware to the approved value on the checklist and replace missing cable ties or clips.
- Verify that vent caps are seated evenly and that no cable is routed across a vent opening or sharp tray edge.
- Apply a light film of dielectric grease only to approved connector surfaces, not to exposed cell tops or inspection labels.
- Close the bay, power the truck, and confirm the unit starts without connector fault, battery disconnect warning, or lift inhibit message.

## PROCEDURE

- No loose hardware, visible corrosion residue, or cable abrasion remains inside the battery bay.
- Main connector housing shows no fresh heat marks or burnt odor after restart.
- The truck powers up cleanly and completes a short drive, lift, and lower functional check.
- The service checklist and any defect notes are attached to the fleet maintenance record before the truck returns to operation.

## ACCEPTANCE CRITERIA

- Capture battery serial placeholder, truck ID, shift, and technician initials.
- If corrosion was cleaned, note the severity as light, moderate, or heavy and whether follow-up inspection is required.
- Open a corrective action ticket for any connector heat event, cracked vent cap, or damaged tray liner.
- Log the restart result and the name of the supervisor who approved the truck for release.

## RECORDS AND CLOSEOUT

- The most realistic training scenario for this guide is a truck that still starts normally but shows early connector discoloration near the charge lead. That creates a retrieval target for questions about when a forklift may continue in limited service and when it must be pulled immediately.
- Another frequent scenario is repeated residue near one corner of the tray caused by poor cap seating after charging. The procedure should lead a reader to inspect vent cap fit before assuming a larger battery defect.
- Because this is a public-safe sample, all identifiers are fictional and all maintenance outcomes are written as examples rather than statements about a real fleet.

## EXAMPLES AND NOTES

## APPENDIX 1: REFERENCE NOTES

This appendix page extends the fictional source material with supporting examples, logging expectations, and exception notes so later retrieval tests can traverse a longer document without relying on private or derived content.

Examples on appendix pages are intentionally consistent with the body of the document. They repeat the same operating vocabulary but add different details such as timings, thresholds, role ownership, and escalation triggers.

- Record location code, equipment identifier, shift, and operator initials on each manual intervention.
- If a procedure references a tolerance band, use the tolerance from the most recent approved revision rather than memory or verbal guidance.
- If a required part is unavailable, tag the task as deferred and note the risk to continued operation in the maintenance or service log.
- For training simulations, supervisors may role-play escalation decisions, but the written record should still reflect the documented path in this guide.

## APPENDIX 2: REFERENCE NOTES
