

POL-01 Document Retention and Redaction Policy

Category: Policies

Synthetic sample document for public portfolio review.

DOCUMENT CONTROL

Policy ID: POL-01-GOV-110

Revision: Rev 1.0

Owner: Operations Governance Office

Audience: All employees, contractors, and project contributors

Review Cycle: Every 12 months or after a control failure

POLICY STATEMENT

This policy defines how fictional project teams store, review, redact, publish, and retire documents that may be used in a public-facing AI demonstration environment. Its purpose is to prevent accidental inclusion of private, identifying, or proprietary material while preserving enough structure for realistic testing.

DEFINITIONS

- Synthetic document: a file created entirely for demonstration or testing and not derived from private operational material.
- Redacted document: a file whose sensitive content has been replaced with safe placeholders and reviewed for residual identifiers in text, metadata, and images.
- Prohibited source: any real internal, customer, employee, vendor, or security-sensitive content that is not approved for unrestricted public release.
- Derived artifact: OCR output, extracted text, embeddings, screenshots, logs, or caches produced from a prohibited source.

REQUIREMENTS

- Keep public repository sample data limited to synthetic or fully redacted content that a third party could inspect without restriction.
- Store working drafts containing unresolved redactions only in a local excluded path until review is complete.
- Review filenames, embedded metadata, document properties, and visible page content before any sample file is committed.
- Retain synthetic demonstration documents as long as they support evaluation, examples, or user-interface testing, provided they remain current with the project scope.
- Delete or replace sample documents that reference outdated controls, deprecated architectures, or naming patterns likely to confuse future reviewers.

PROHIBITED PRACTICES

- Do not commit real manuals, internal screenshots, vendor exports, customer notes, OCR output from private files, or debug logs derived from private materials.
- Do not rely on simple name replacement if the surrounding details still reveal a real site,

incident, employee, or customer context.

- Do not copy policy language from a private handbook into a public sample even if obvious identifiers are removed.
- Do not treat generated embeddings, vector indexes, or extracted chunks from private sources as safe simply because the original file is absent from the repository.

EXCEPTIONS AND ESCALATION

- If a team believes a real document excerpt is necessary for demonstration, it must be escalated to the policy owner and replaced with a synthetic reconstruction unless explicit written release approval exists.
- If uncertainty remains after review, treat the material as prohibited until a second reviewer signs off on its safety.
- Exception approvals must name the approving role, scope of use, expiration date, and required follow-up controls.

OVERSIGHT AND ENFORCEMENT

- Project maintainers should periodically sample the repository for unsafe artifacts, including PDF metadata, hidden spreadsheet tabs, OCR caches, and leftover local database files.
- Violations require immediate removal from the branch, notification to the project owner, and a review of any downstream artifacts generated from the unsafe material.
- Repeat violations should result in narrower contribution permissions until the contributor demonstrates understanding of the public-release boundary.

IMPLEMENTATION NOTES

Teams implementing this policy should translate the requirements into checklists, approval forms, and repository controls that are easy to audit. Local convenience does not override documented retention, redaction, or access requirements.

Where two rules appear to conflict, the stricter public-release rule governs until the policy owner publishes a written exception or clarifying revision.

APPENDIX 1: REFERENCE NOTES

This appendix page extends the fictional source material with supporting examples, logging expectations, and exception notes so later retrieval tests can traverse a longer document without relying on private or derived content.

Examples on appendix pages are intentionally consistent with the body of the document. They repeat the same operating vocabulary but add different details such as timings, thresholds, role ownership, and escalation triggers.

- Record location code, equipment identifier, shift, and operator initials on each manual intervention.
- If a procedure references a tolerance band, use the tolerance from the most recent approved revision rather than memory or verbal guidance.
- If a required part is unavailable, tag the task as deferred and note the risk to continued operation in the maintenance or service log.
- For training simulations, supervisors may role-play escalation decisions, but the written record should still reflect the documented path in this guide.
